# Program to create a bank account

'''

Create an account that has two attributes: owner and balance
Create two methods: deposit and withdrawl

'''
```

In [80]:
```
# Creating class account

class account():

    def __init__(self, owner, balance):

        self.owner=owner
        self.balance=balance

    # Create deposit method

    def deposit(self, deposit_amount):

        self.balance = self.balance + deposit_amount

        print('You have added {} to the account'.format(deposit_amount))

    def withdrawl(self, withdrawl_amount):

        if self.balance >= withdrawl_amount:

            self.balance = self.balance - withdrawl_amount

        else:

            print('Enough funds not available')

    def ac_summary(self):

        return f"a/c owner: {self.owner}. a/c balance: {self.balance}"
```

In [74]:
```
# Create an instance of the class

a = account('ameya', 100)
```

In [75]:
```
a.owner
```

Out[75]:
```
'ameya'
```

In [76]:
```
a.balance
```

Out[76]:
```
100
```

In [84]:
```
a.ac_summary()
```

Out[84]:
```
'a/c owner: ameya. a/c balance: 1600'
```

In [87]:
```
a.deposit(500)
a.balance
```

```
You have add 500 to the account
```

Out[87]:
```
2600
```

In [89]:
```
a.withdrawl(2000)
a.balance
```

Out[89]:
```
600
```
